Team #

			
Manon Vu Huu	Nàdia Pelegay-Royo		
Data work Supervised	Data work Unsupervised		

* The Keywords above should aim to give a rough idea of contributions in terms of material/scope; who did what in the pipeline; so that we know whom to expect questions from, and to distribute questions evenly. By default we assume that all authors contributed equally in terms of effort. Any optional comments about the team composition

Highlights (4–6):

(these should be the main ‘takeaway’ points for an audience to your presentation)

Data Work

Feature selection

Cosine similarity

Supervised Learning

Brief Report:

Provide an indication of the scope, and how you proceeded, what was left out of the presentation (if anything). Please highlight **keywords** in bold like that; anything that relates to material/algorithms seen in the course. This is a bit like an abstract of a paper, except extended to give a feel of your working. Hint: we will attempt to align questions with the scope as stated here. Also: please state your main references if you had anything beyond the material of the course.

Our work aims to provide a spotify-like recommendation system purely based on audio features. As in any of our coursework TDs, we first get data and preprocess it. Then our work is separated by supervised and unsupervised learning. For the supervised part, we intuitively try two kNN approaches, then logistic regression and random forest classifier to get lists of song recommendations. We compare all of our results by cosine similarity. For the unsupervised part, ...

Description of Appendices (Optional):

Don't feel the temptation to keep a record and show everything you did, or display every line of code you wrote. Much like in an exam, 'latent effort' will show through. But, if there is something you feel you'd like to show, append it to the rest of the file, but mention here what it is and where to find it, e.g., 'additional experiments on pages 4-9'.
